

Lab 1 — Use-Case Flow

Use-Case Flow

Use case id : FR-003

Use case name : Inspect product

Main actor : Inspection agent

1. Preconditions

The Buyer must have placed an order for the second-hand product. The order must be ready for inspection. The Inspection Agent has access to the product and the relevant order details.

2. Main Success Scenario

1. The Inspection Agent logs into the marketplace.
2. The Inspection Agent views the product/order requiring inspection.
3. The system displays the product and order details.
4. The Inspection Agent physically checks the product.
5. The Inspection Agent verifies the product's condition against the information provided by the Seller.
6. The Inspection Agent records the product condition in the system.
7. The Inspection Agent submits the inspection report.
8. The system validates the submitted report.
9. The system stores the inspection report with the corresponding order.
10. The system notifies the Buyer that the inspection has been completed.

3. Alternate Flow

If the report is incomplete or invalid, the system asks the Inspection Agent to correct and resubmit it. The system then validates and stores the corrected report. If the inspection is not completed, the order remains "Under Inspection" and the escrow payment stays locked.

4. Postconditions

The inspection report is stored, and the Buyer is notified. The Buyer can review the report, while payment remains locked until a decision is made. Approval allows payment release, while a dispute keeps the funds frozen.
